SUMMARY

Final-year AI & ML student who builds end-to-end systems — computer vision pipelines, real-time inference engines, full-stack backends, and deployed applications. Comfortable taking a project from idea to working product independently, with a focus on systems that actually solve problems.

SKILLS

Languages: Python, C++, SQL **Frameworks & Libraries:** TensorFlow, MediaPipe, OpenCV, FastAPI, React
Tools & Platforms: Git, GitHub, Docker (basics), Power BI **Domains:** Computer Vision, Machine Learning, Backend Development

EXPERIENCE

- Python Developer Intern** · Codec Technologies Feb 2025 – May 2025
- Developed Python projects end-to-end across the full delivery cycle — from scoping and implementation to testing and handoff.
 - Built reusable automation scripts and data processing utilities; met all delivery timelines on assigned modules consistently.
- Machine Learning Intern** · SkillCraft Technology 1 Month · 2025
- Owned the complete ML workflow independently: dataset collection, cleaning, feature engineering, model training, and evaluation.
 - Applied preprocessing techniques that improved model accuracy on the assigned supervised learning task.

PROJECTS

- ForensiAI — Cybersecurity Forensic Platform** | Python · FastAPI · React · ML · Log Analysis
- Built an AI-powered forensics platform that processes 2.5M+ logs for automated threat detection, anomaly scoring, and risk classification — designed to cut down manual investigation time significantly.
 - Designed a non-blocking FastAPI backend for high-volume log ingestion and a React dashboard for incident timeline visualization and severity triage.
- EchoLink — Offline Peer-to-Peer Communication Platform** | Python · Networking · React
- Built a fully decentralized messaging platform that operates without internet or a central server, using local network protocols to enable direct device-to-device communication.
 - Designed for emergency and low-infrastructure scenarios where standard connectivity is unavailable; handles connection drops and partial network availability gracefully.
- KitchenSense AI — Smart Kitchen Management System** | Python · TensorFlow · OpenCV · React
- Integrated a computer vision module for ingredient identification from camera input with inventory tracking, expiry prediction, and AI-driven recipe recommendations.
 - Built to reduce household food waste by surfacing expiry alerts and suggesting recipes based on what is actually available in stock.
- ASL-to-Text/Speech Translator** | Python · MediaPipe · TensorFlow · OpenCV
- Built a real-time American Sign Language recognition system that translates hand gestures to text and synthesized speech using a live webcam feed.
 - Used MediaPipe for hand landmark extraction and a custom deep learning classifier trained to handle varied lighting and hand orientations for reliable accessibility use.

EDUCATION

B.E. in Artificial Intelligence & Machine Learning Graduating 2027
MVJ College of Engineering, Bengaluru

ACHIEVEMENTS

 **1st Place** — Vibeathon Hackathon, Gopalan College of Engineering (April 2026) — competed against teams from multiple colleges; won for overall project execution and technical depth.
